	32K		HMS99C58S	

FEATURE

- Fully compatible to standard MCS-51 microcontroller
- Wide operating frequency up to 40MHz
(for more detail, See "HMS99C51S/52S/54S/56S/58S SELECTION GUIDE" on page 1)
- X2 Speed Improvement capability (**X2 Mode : 6 clocks/machine cycle**)
20MHz @5V (Equivalent to 40MHz @5V)
- ISP(In-System Programming) using Standard V_{CC} Power Supply
- Boot ROM Contains Low Level FLASH Programming Routines and a Default Serial Loader
- 4K/8K/16K/24K/32K bytes FLASH user program memory
 - Byte Write and Block(2K, 8K Bytes) Erase
- 2K bytes FLASH boot loader
- 1 byte Hardware Security Byte (HSB)
- 256 bytes RAM
- 64K bytes external program memory space
- 64K bytes external data memory space
- Four 8-bit ports
- Three 16-bit Timers / Counters (Timer2 with up/down counter feature)
- UART
- One clock output port
- Programmable ALE pin enable / disable (Low **EMI**)
- Six interrupt sources, two priority levels
- Power saving Idle and power down mode
- P-DIP-40, P-LCC-44, P-MQFP-44 package
- Temperature Ranges : -40°C ~ 85°C

Description

The Flash memory increases EPROM and ROM functionality with in-circuit electrical erasure and programming. It contains 4K, 8K, 16K, 24K or 32K bytes of program memory. This memory is both parallel and serial In-System Programmable(ISP). The ISP allows devices to alter their own program memory in the actual end product under software control through UART ports. A default serial loader(bootloader) program supports ISP of the Flash memory. The programming does not require external 12V programming voltage. The necessary high programming voltage is generated on-chip using the standard V_{CC} pins of the microcontroller.

PIN CONFIGURATION

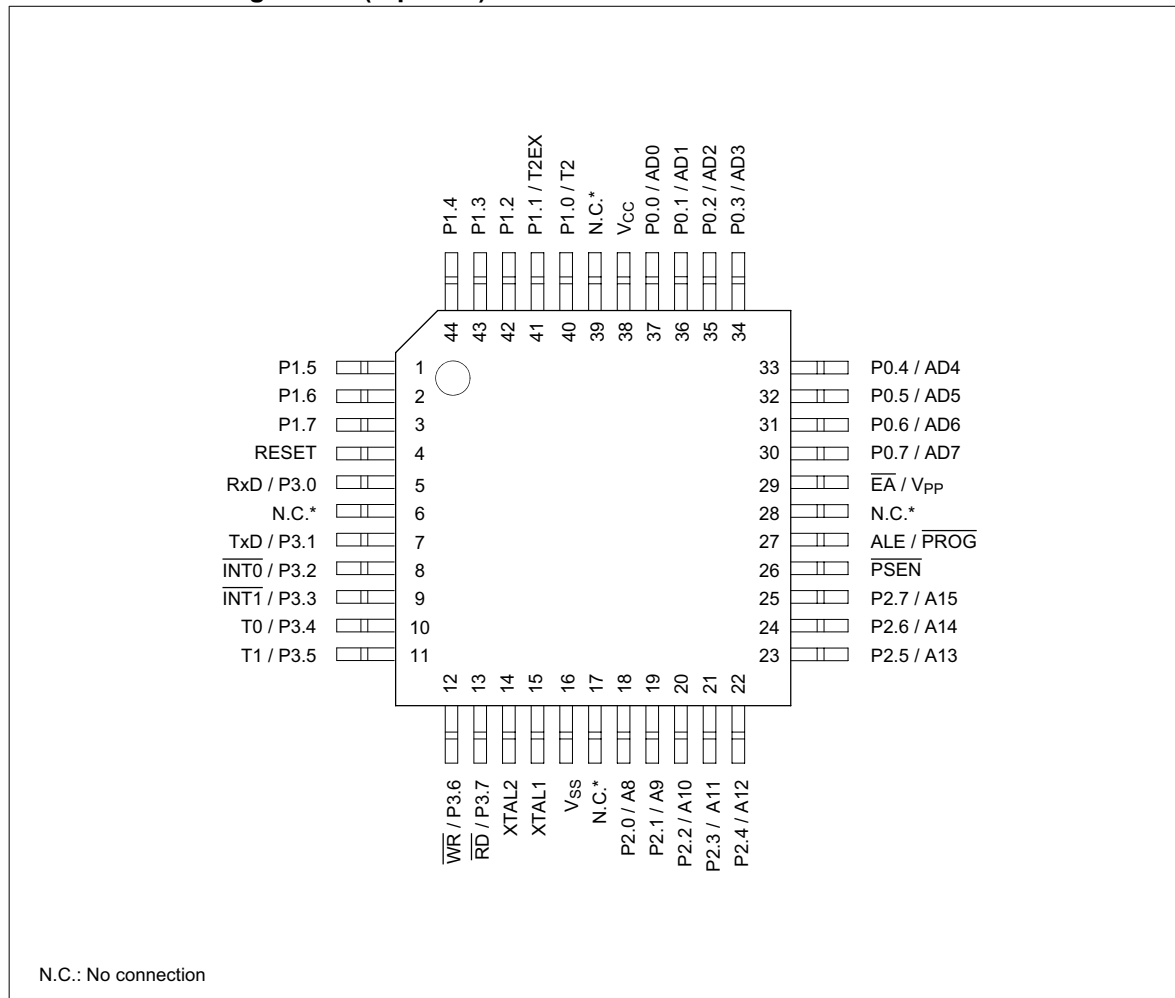

44-Pin Configuration (top view)

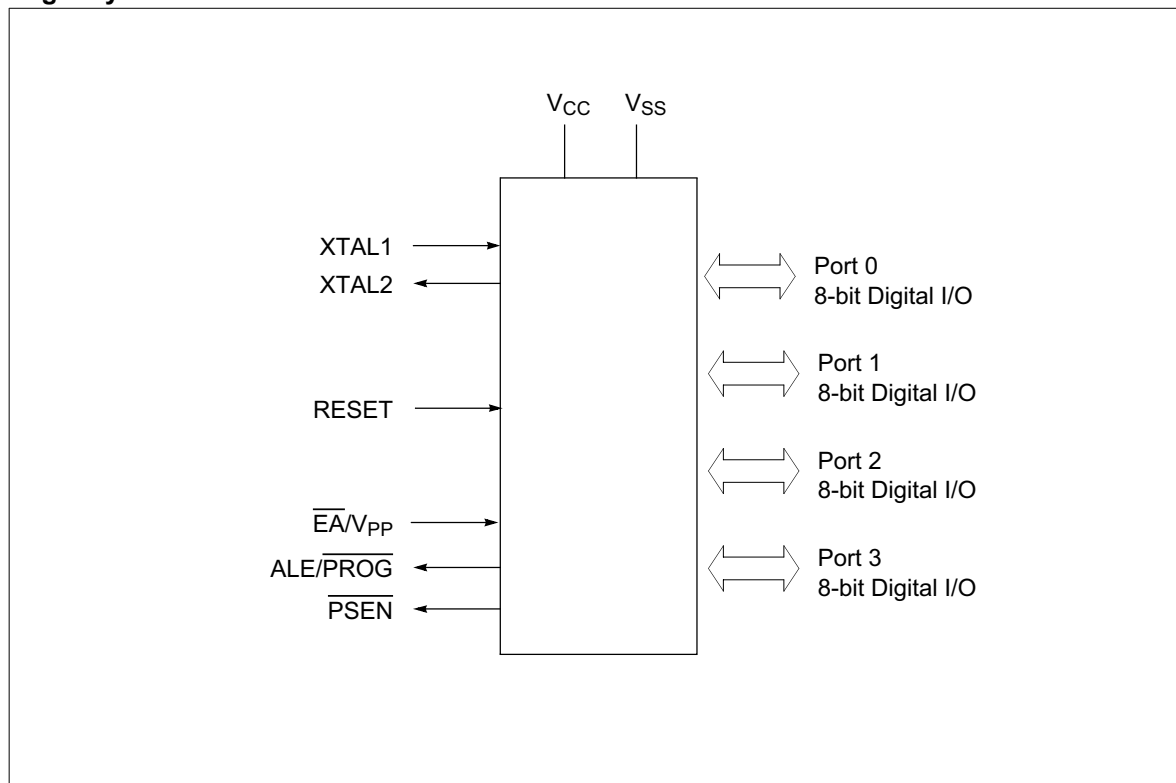

40-PDIP Pin Configuration (top view)

44-MQFP Pin Configuration (top view)

Logic Symbol

PIN DEFINITIONS AND FUNCTIONS

Symbol	Pin Number			Input/ Output	Function
	PLCC- 44	PDIP- 40	MQFP- 44		
P1.0-P1.7	2-9	1-8	40-44, 1-3	I/O	<p>Port1 Port 1 is an 8-bit bidirectional I/O port with internal pull-ups. Port 1 pins that have 1s written to them are pulled high by the internal pull-up resistors and can be used as inputs. As inputs, port 1 pins that are externally pulled low will source current because of the pull-ups (I_{IL}, in the DC characteristics). Port1 also serves alternate functions of Timer 2 as follows.</p> <p>P1.0 / T2, Clock Out : Timer/counter 2 external count input, Clock Out P1.1 / T2EX :Timer/counter 2 trigger input</p> <p>Port1 receives the low-order address bytes during Flash programming and verifying.</p>
P3.0-P3.7	11, 13-19	10-17	5, 7-13	I/O	<p>Port 3 Port 3 is an 8-bit bidirectional I/O port with internal pull-ups. Port 3 pins that have 1s written to them are pulled high by the internal pull-up resistors and can be used as inputs. As inputs, port 3 pins that are externally pulled low will source current because of the pull-ups (I_{IL}, in the DC characteristics). Port 3 also serves the special features of the 80C51 family, as listed below.</p> <p>P3.0 / RxD receiver data input (asynchronous) or data input/output(synchronous) of serial interface 0 P3.1 / TxD transmitter data output (asynchronous) or clock output (synchronous) of the serial interface 0 P3.2 / $\overline{\text{INT0}}$ interrupt 0 input/timer 0 gate control P3.3 / $\overline{\text{INT1}}$ interrupt 1 input/timer 1 gate control P3.4 / T0 counter 0 input P3.5 / T1 counter 1 input P3.6 / $\overline{\text{WR}}$ the write control signal latches the data byte from port 0 into the external data memory P3.7 / $\overline{\text{RD}}$ the read control signal enables the external data memory to port 0</p>
XTAL2	20	18	14	O	<p>XTAL2 Output of the inverting oscillator amplifier.</p>

Symbol	Pin Number			Input/ Output	Function
	PLCC- 44	PDIP- 40	MQFP- 44		
XTAL1	21	19	15	I	XTAL1 Input to the inverting oscillator amplifier and input to the internal clock generator circuits. To drive the device from an external clock source, XTAL1 should be driven, while XTAL2 is left unconnected. There are no requirements on the duty cycle of the external clock signal, since the input to the internal clocking circuitry is divided down by a divide-by-two flip-flop. Minimum and maximum high and low times as well as rise and fall times specified in the AC characteristics must be observed.
P2.0-P2.7	24-31	21-28	18-25	I/O	Port 2 Port 2 is an 8-bit bidirectional I/O port with internal pull-ups. Port 2 pins that have 1s written to them are pulled high by the internal pull-up resistors and can be used as inputs. As inputs, port 2 pins that are externally pulled low will source current because of the pull-ups (I_{IL} , in the DC characteristics). Port 2 emits the high-order address byte during fetches from external program memory and during accesses to external data memory that use 16-bit addresses (MOVX @DPTR). In this application it uses strong internal pull-ups when outputting 1s. During accesses to external data memory that use 8-bit addresses (MOVX @Ri), port 2 emits the contents of the P2 special function register. Some Port 2 pins receive the high-order address bits during flash program, verify, and erase operations.
$\overline{\text{PSEN}}$	32	29	26	O	The Program Store Enable The read strobe to external program memory when the device is executing code from the external program memory. PSEN is activated twice each machine cycle, except that two PSEN activations are skipped during each access to external data memory. PSEN is not activated during fetches from internal program memory.
RESET	10	9	4	I	RESET A high level on this pin for two machine cycles while the oscillator is running resets the device. The port pins will be driven to their reset condition when a minimum V_{IH} voltage is applied whether the oscillator is running or not. An internal diffused resistor to V_{SS} permits power-on reset using only an external capacitor to V_{CC} .

Symbol	Pin Number			Input/ Output	Function
	PLCC- 44	PDIP- 40	MQFP- 44		
$\overline{\text{ALE}} / \text{PROG}$	33	30	27	O	<p>The Address Latch Enable / Program pulse</p> <p>Output pulse for latching the low byte of the address during an access to external memory. In normal operation, ALE is emitted at a constant rate of 1/6 the oscillator frequency, and can be used for external timing or clocking. Note that one ALE pulse is skipped during each access to external data memory. This pin is also the program pulse input (PROG) during EPROM programming.</p> <p>If desired, ALE operation can be disabled by setting bit 0 of SFR location 8EH. With this bit set, the pin is weakly pulled high. The ALE disable feature will be terminated by reset. Setting the ALE-disable bit has no affect if the microcontroller is in external execution mode.</p>
$\overline{\text{EA}} / V_{\text{PP}}$	35	31	29	I	<p>External Access Enable / Program Supply Voltage</p> <p>$\overline{\text{EA}}$ must be externally held low to enable the device to fetch code from external program memory locations 0000H to FFFFH. If $\overline{\text{EA}}$ is held high, the device executes from internal program memory unless the program counter contains an address greater than its internal memory size. This pin also receives the 12.75V programming supply voltage (V_{PP}) during EPROM programming.</p> <p>Note; however, that if any of the Lock bits are programmed, $\overline{\text{EA}}$ will be internally latched on reset.</p>
P0.0-P0.7	36-43	32-39	30-37	I/O	<p>Port 0</p> <p>Port 0 is an 8-bit open-drain bidirectional I/O port. Port 0 pins that have 1s written to them float and can be used as high-impedance inputs.</p> <p>Port 0 is also the multiplexed low-order address and data bus during accesses to external program and data memory. In this application it uses strong internal pull-ups when emitting 1s. Port 0 also receives and outputs the code bytes during program and verification respectively in the GMS99X5X. External pull-up resistors are required during program verification.</p>
V_{SS}	22	20	16	-	Circuit ground potential
V_{CC}	44	40	38	-	Supply terminal for all operating modes
N.C.	1,12 23,34	-	6,17 28,39	-	No connection

FUNCTIONAL DESCRIPTION

The HMS99C51S/52S/54S/56S/58S are fully compatible to the standard 8051 microcontroller family.

It is compatible with the general 8051 family, while maintaining all architectural and operational characteristics of the general 8051 family.

Figure 1 shows a block diagram of the HMS99C51S/52S/54S/56S/58S.

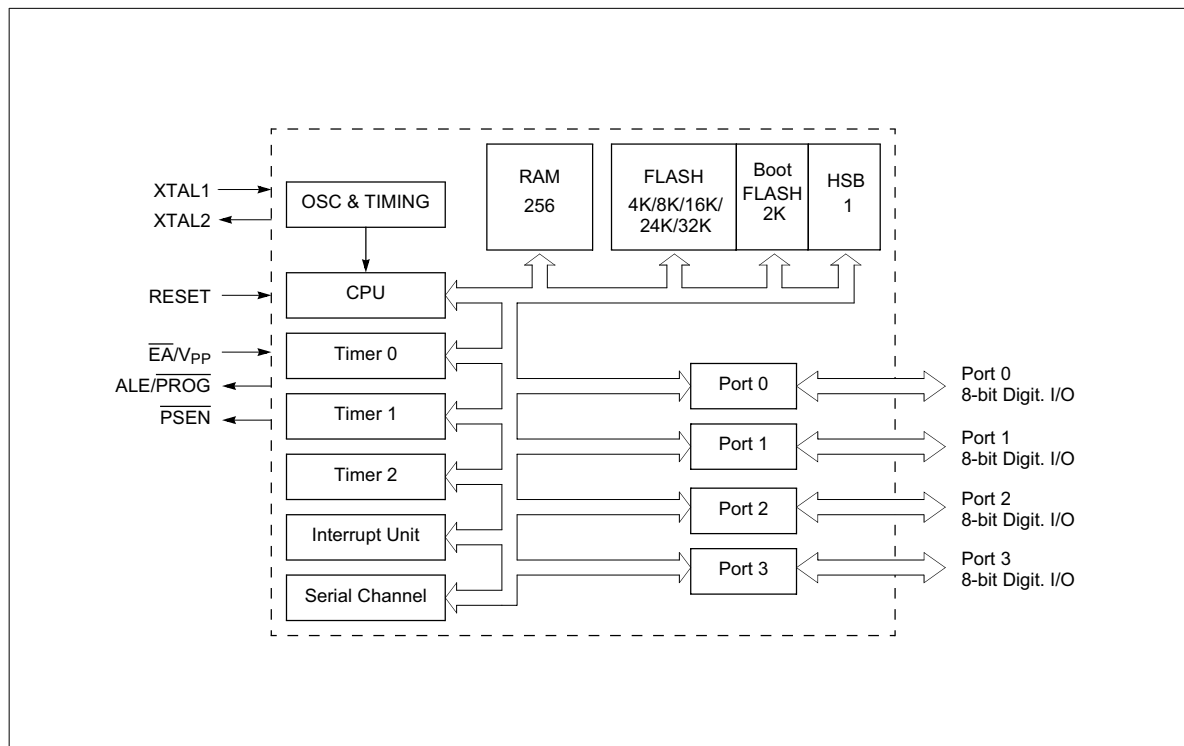

Figure 1. Block Diagram of the HMS99C51S/52S/54S/56S/58S

SPECIAL FUNCTION REGISTERS

All registers, except the program counter and the four general purpose register banks, reside in the special function register area.

The 28 special function registers (SFR) include pointers and registers that provide an interface between the CPU and the other on-chip peripherals. There are also 128 directly addressable bits within the SFR area.

All SFRs are listed in Table 1, Table 2, and Table 3.

In Table 1 they are organized in numeric order of their addresses. In Table 2 they are organized in groups which refer to the functional blocks of the HMS99C51S/52S/54S/56S/58S. Table 3 illustrates the contents of the SFRs

X2 MODE

The HMS99C51S/52S/54S/56S/58S core needs only 6 clock periods per machine cycle in X2 mode. This feature called “X2” provides the following advantages:

- Divide frequency crystals by 2 (cheaper crystals) while keeping same CPU power.
- Save power consumption while keeping same CPU power (oscillator power saving).
- Save power consumption by dividing dynamically operating frequency by 2 in operating and idle modes.
- Increase CPU power by 2 while keeping same crystal frequency.

In order to keep the original C51 compatibility, a divider by 2 is inserted between the XTAL1 signal and the main clock input of the core (phase generator). This divider may be disabled by software.

X2 Mode Description

The clock for the whole circuit and peripheral is first divided by two before being used by the CPU core and peripherals. This allows any cyclic ratio to be accepted on XTAL1 input. In X2 mode, as this divider is bypassed, the signals on XTAL1 must have a cyclic ratio between 40 to 60%. Figure 2. shows the clock generation block diagram. X2 bit is validated on XTAL1÷2 rising edge to avoid glitches when switching from X2 to STD mode. Figure 3. shows the mode switching waveforms:

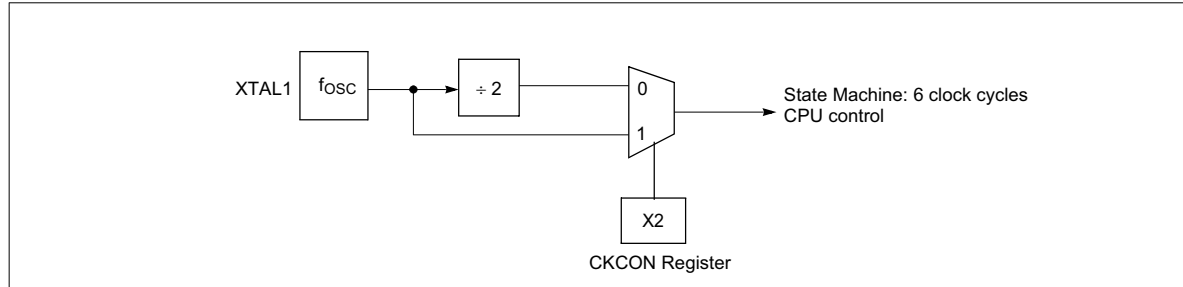

Figure 2. Clock Generation Diagram

The X2 bit in the CKCON register allows to switch from 12 clock cycles per instruction to 6 clock cycles and vice versa. At reset, the standard speed is activated (STD mode). Setting this bit activates the X2 feature(X2 mode).

CAUTION

In order to prevent any incorrect operation while operating in X2 mode, user must be aware that all peripherals using clock frequency as time reference (UART, timers) will have their time reference divided by two. For example a free running timer generating an interrupt every 30 ms will then generate an interrupt every 15 ms. UART with 2400 baud rate will have 4800 baud rate.

Figure 3. Mode Switching Waveforms

TIMER / COUNTER 0 AND 1

Timer/Counter 0 and 1 can be used in four operating modes as listed in Table 4:

Mode	Description	TMOD				Input Clock	
		Gate	C/ \bar{T}	M1	M0	internal	external (Max.)
0	8-bit timer/counter with a divide-by-32 prescaler	X	X	0	0	$f_{OSC} \div (12 \times 32)$	$f_{OSC} \div (24 \times 32)$
1	16-bit timer/counter	X	X	0	1	$f_{OSC} \div 12$	$f_{OSC} \div 24$
2	8-bit timer/counter with 8-bit auto-reload	X	X	1	0	$f_{OSC} \div 12$	$f_{OSC} \div 24$
3	Timer/counter 0 used as one 8-bit timer/counter and one 8-bit timer Timer 1 stops	X	X	1	1	$f_{OSC} \div 12$	$f_{OSC} \div 24$

Table 4. Timer/Counter 0 and 1 Operating Modes

In the “timer” function ($C/\bar{T} = “0”$) the register is incremented every machine cycle. Therefore the count rate is $f_{OSC}/12$.

In the “counter” function the register is incremented in response to a 1-to-0 transition at its corresponding external input pin (P3.4/T0, P3.5/T1). Since it takes two machine cycles to detect a falling edge the max. count rate is $f_{OSC}/24$. External inputs $\overline{INT0}$ and $\overline{INT1}$ (P3.2, P3.3) can be programmed to function as a gate to facilitate pulse width measurements. Figure 4 illustrates the input clock logic.

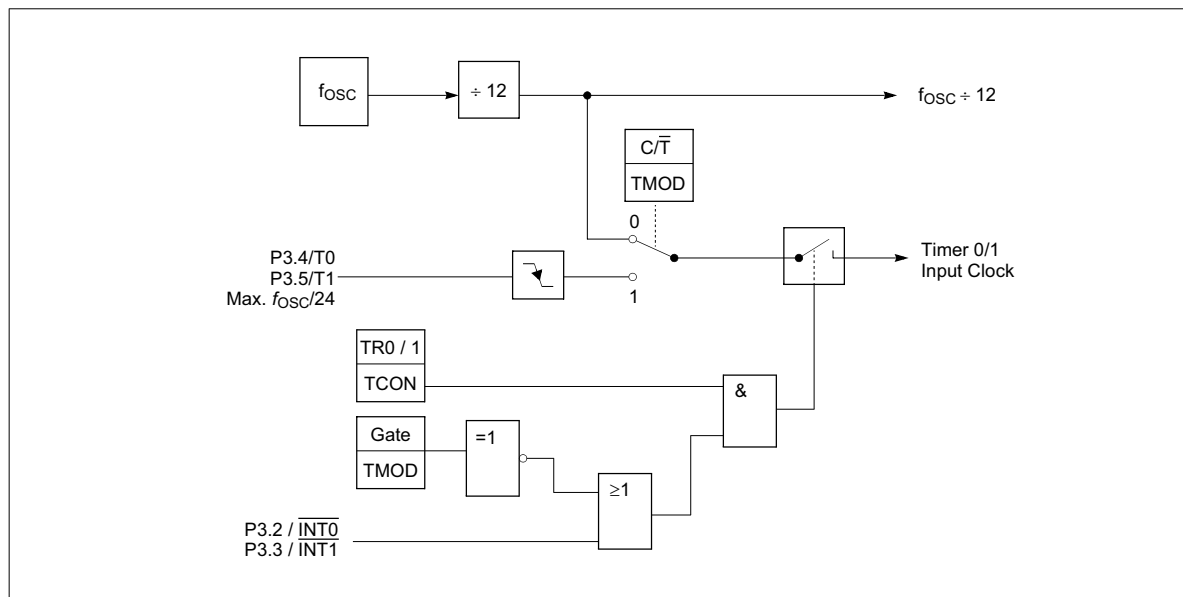

Figure 4. Timer/Counter 0 and 1 Input Clock Logic

TIMER 2

Timer 2 is a 16-bit timer/Counter with an up/down count feature. It can operate either as timer or as an event counter which is selected by bit $C/\overline{T}2$ (T2CON.1). It has three operating modes as shown in Table 5.

Mode	T2CON			T2M OD	T2C ON	P1. 1/ T2 EX	Remarks	Input Clock	
	RCLK or TCLK	CP/ RL2	TR2	DCE N	EXE N2			internal	external (P1.0/T2)
16-bit Auto-Reload	0	0	1	0	0	X	reload upon over-flow	$f_{osc} \div 12$	Max. $f_{osc} \div 24$

Table 5. Timer/Counter 2 Operating Modes

Note: ↓ =  falling edge

SERIAL INTERFACE (UART)

The serial port is full duplex and can operate in four modes (one synchronous mode, three asynchronous modes) as illustrated in Table 6. The possible baud rates can be calculated using the formulas given in Table 7.

Mode	SCON		Baudrate	Description
	SM0	SM1		
0	0	0	$\frac{f_{OSC}}{12}$	Serial data enters and exits through RxD. TxD outputs the shift clock. 8-bit are transmitted/received (LSB first)
1	0	1	Timer 1/2 overflow rate	8-bit UART 10 bits are transmitted (through TxD) or received (RxD)
2	1	0	$\frac{f_{OSC}}{32}$ or $\frac{f_{OSC}}{64}$	9-bit UART 11 bits are transmitted (TxD) or received (RxD)
3	1	1	Timer 1/2 overflow rate	9-bit UART Like mode 2 except the variable baud rate

Table 6. UART Operating Modes

Baud Rate derived from	Interface Mode	Baudrate
Oscillator	0	$\frac{f_{OSC}}{12}$
	2	$\frac{2^{SMOD}}{64} \times f_{OSC}$
Timer 1 (16-bit timer) (8-bit timer with 8-bit auto reload)	1,3	$\frac{2^{SMOD}}{32} \times (Timer\ 1\ overflow)$
	1,3	$\frac{2^{SMOD}}{32} \times \frac{f_{OSC}}{12 \times [256 - (TH1)]}$
Timer 2	1,3	$\frac{f_{OSC}}{32 \times [65536 - (RC2H, RC2L)]}$

Table 7. Formulas for Calculating Baud rates

INTERRUPT SYSTEM

The HMS99C51S/52S/54S/56S/58S provide 6 (above 8K bytes ROM version) interrupt sources with two priority levels. Figure 5 gives a general overview of the interrupt sources and illustrates the request and control flags.

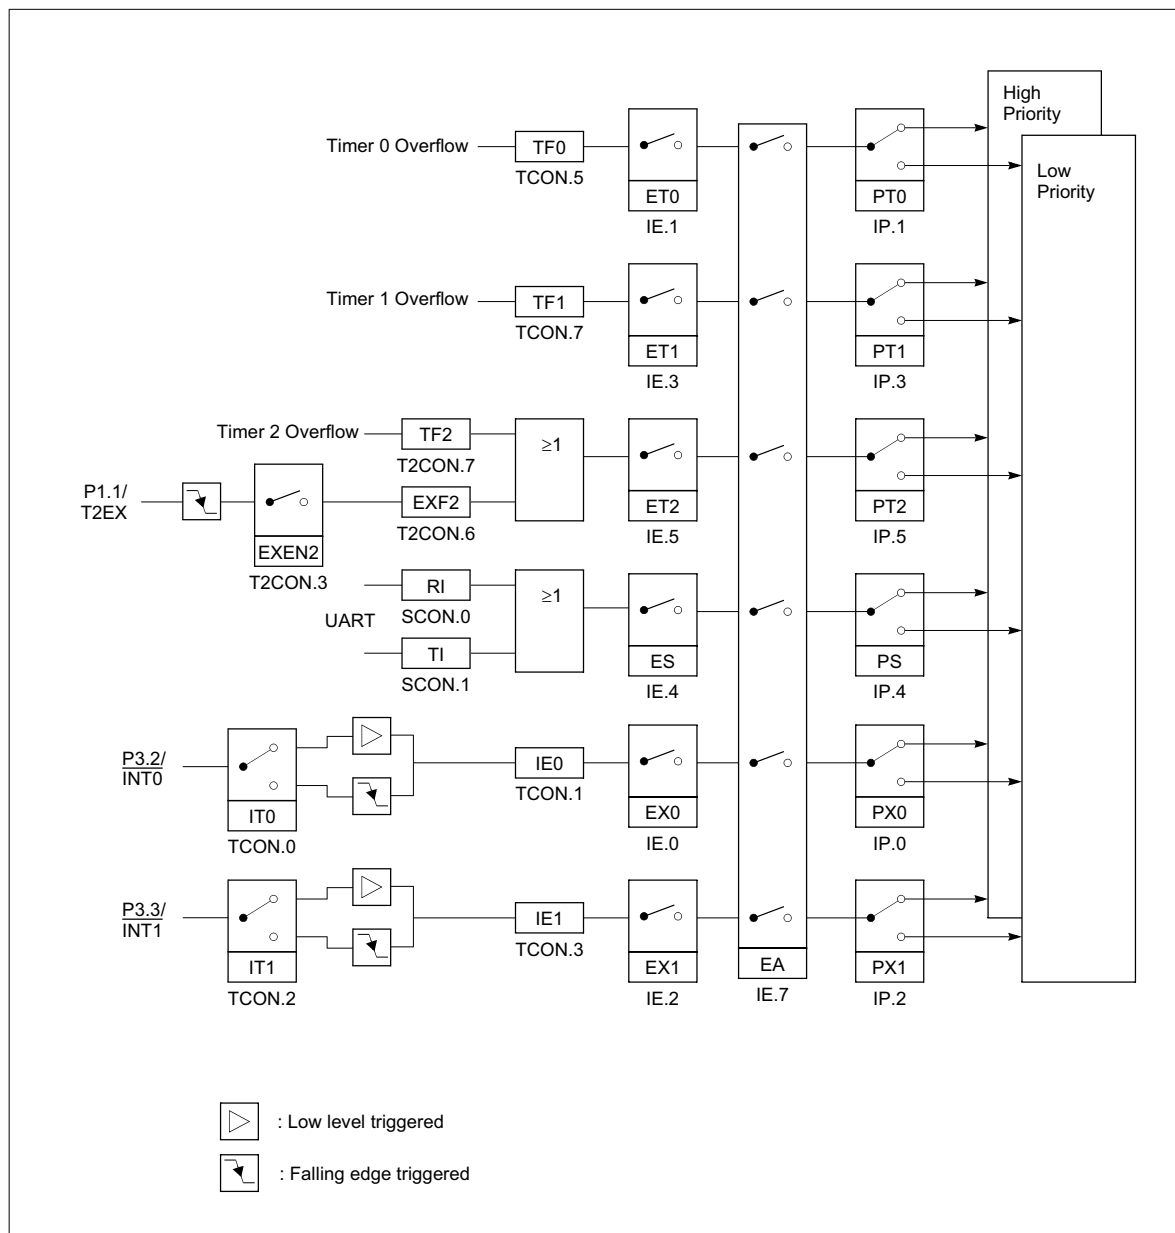

Figure 5. Interrupt Request Sources

Source (Request Flags)	Vectors	Vector Address
RESET	RESET	0000 _H
IE0	External interrupt 0	0003 _H
TF0	Timer 0 interrupt	000B _H
IE1	External interrupt 1	0013 _H
TF1	Timer 1 interrupt	001B _H
RI + TI	Serial port interrupt	0023 _H
TF2 + EXF2	Timer 2 interrupt	002B _H

Table 8. Interrupt Sources and their Corresponding Interrupt Vectors

A low-priority interrupt can itself be interrupted by a high-priority interrupt, but not by another low priority interrupt. A high-priority interrupt cannot be interrupted by any other interrupt source.

If two requests of different priority level are received simultaneously, the request of higher priority is serviced. If requests of the same priority are received simultaneously, an internal polling sequence determines which request is serviced. Thus within each priority level there is a second priority structure determined by the polling sequence as shown in Table 9.

Interrupt Source		Priority
External Interrupt 0	IE0	High
Timer 0 Interrupt	TF0	↓
External Interrupt 1	IE1	↓
Timer 1 Interrupt	TF1	↓
Serial Channel	RI + TI	↓
Timer 2 Interrupt	TF2 + EXF2	Low

Table 9. Interrupt Priority-Within-Level

Power Saving Modes

Two power down modes are available, the Idle Mode and Power Down Mode.

The bits PDE and IDLE of the register PCON select the Power Down mode or the Idle mode, respectively. If the Power Down mode and the Idle mode are set at the same time, the Power Down mode takes precedence. Table 10 gives a general overview of the power saving modes.

Mode	Entering Instruction Example	Leaving by	Remarks
Idle mode	ORL PCON, #01H	- Enabled interrupt - Hardware Reset	CPU is gated off CPU status registers maintain their data. Peripherals are active
Power-Down mode	ORL PCON, #02H	Hardware Reset	Oscillator is stopped, contents of on-chip RAM and SFR's are maintained (leaving Power Down Mode means redefinition of SFR contents).

Table 10. Power Saving Modes Overview

In the Power Down mode of operation, V_{CC} can be reduced to minimize power consumption. It must be ensured, however, that V_{CC} is not reduced before the Power Down mode is invoked, and that V_{CC} is restored to its normal operating level, before the Power Down mode is terminated. The reset signal that terminates the Power Down mode also restarts the oscillator. The reset should not be activated before V_{CC} is restored to its normal operating level and must be held active long enough to allow the oscillator to restart and stabilize (similar to power-on reset).

ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings

Ambient temperature under bias (T_A).....	-40 to + 85 °C
Storage temperature (T_{ST}).....	-65 to + 150 °C
Voltage on V_{CC} pins with respect to ground (V_{SS})	-0.5V to 6.5V
Voltage on any pin with respect to ground (V_{SS})	-0.5V to $V_{CC} + 0.5V$
Input current on any pin during overload condition.....	-10mA to +10mA
Absolute sum of all input currents during overload condition.....	100mA
Power dissipation	200mW

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage of the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for longer periods may affect device reliability. During overload conditions ($V_{IN} > V_{CC}$ or $V_{IN} < V_{SS}$) the Voltage on V_{CC} pins with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

DC Characteristics

DC Characteristics for HMS99C51S/52S/54S/56S/58S

$V_{CC} = 5V \pm 10\%$, $V_{SS} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$

Parameter	Symbol	Limit Values		Unit	Test Conditions
		Min.	Max.		
Input low voltage (except \overline{EA} , RESET)	V_{IL}	-0.5	$0.2V_{CC} - 0.1$	V	$V_{CC} = 5.5V$
Input low voltage (\overline{EA})	V_{IL1}	-0.5	$0.2V_{CC} - 0.1$	V	$V_{CC} = 5.5V$
Input low voltage (RESET)	V_{IL2}	-0.5	$0.2V_{CC} + 0.1$	V	$V_{CC} = 5.5V$
Input high voltage (except XTAL1, \overline{EA} , RESET)	V_{IH}	$0.2V_{CC} + 0.9$	$V_{CC} + 0.5$	V	$V_{CC} = 4.5V$
Input high voltage to XTAL1	V_{IH1}	$0.7V_{CC}$	$V_{CC} + 0.5$	V	$V_{CC} = 4.5V$
Input high voltage to \overline{EA} , RESET	V_{IH2}	$0.6V_{CC}$	$V_{CC} + 0.5$	V	$V_{CC} = 4.5V$
Output low voltage (ports 1, 2, 3)	V_{OL}	-	0.45	V	$V_{CC} = 5.5V$, $I_{OL} = 1.6mA$ ¹⁾
Output low voltage (port 0, ALE, PSEN)	V_{OL1}	-	0.45	V	$V_{CC} = 5.5V$, $I_{OL} = 3.2mA$ ¹⁾
Output high voltage (ports 1, 2, 3)	V_{OH}	2.4 $0.9V_{CC}$	-	V	$V_{CC} = 4.5V$, $I_{OH} = -80\mu A$ $V_{CC} = 4.5V$, $I_{OH} = -10\mu A$
Output high voltage (port 0 in external bus mode, ALE, PSEN)	V_{OH1}	2.4 $0.9V_{CC}$	-	V	$V_{CC} = 4.5V$, $I_{OH} = -800\mu A$ ²⁾ $V_{CC} = 4.5V$, $I_{OH} = -80\mu A$ ²⁾
Logic 0 input current (ports 1, 2, 3)	I_{IL}	-10	-65	μA	$V_{IN} = 0.45V$
Logical 1-to-0 transition current (ports 1, 2, 3)	I_{TL}	-65	-650	μA	$V_{IN} = 2.0V$
Input leakage current (port 0, \overline{EA})	I_{LI}	-	± 1	μA	$0.45 < V_{IN} < V_{CC}$
Pin capacitance	C_{IO}	-	10	pF	$f_C = 1MHz$ $T_A = 25^\circ C$
Power supply current:					
Active mode, 4MHz ³⁾	I_{CC}	-	8	mA	$V_{CC} = 5V$ ⁴⁾
Idle mode, 4MHz ⁴⁾	I_{CC}		4	mA	$V_{CC} = 5V$ ⁵⁾
Active mode, 24 MHz ⁴⁾	I_{CC}		25	mA	$V_{CC} = 5V$ ⁴⁾
Idle mode, 24MHz ⁴⁾	I_{CC}		10	mA	$V_{CC} = 5V$ ⁵⁾
Active mode, 40 MHz ⁴⁾	I_{CC}		30	mA	$V_{CC} = 5V$ ⁴⁾
Idle mode, 40 MHz ⁴⁾	I_{CC}		15	mA	$V_{CC} = 5V$ ⁵⁾
Power Down Mode ⁴⁾	I_{PD}		50	μA	$V_{CC} = 5V$ ⁶⁾

- 1) Capacitive loading on ports 0 and 2 may cause spurious noise pulses to be superimposed on the V_{OL} of ALE and port 3. The noise is due to external bus capacitance discharging into the port 0 and port 2 pins when these pins make 1-to-0 transitions during bus operation. In the worst case (capacitive loading: $> 50\text{pF}$ at 3.3V , $> 100\text{pF}$ at 5V), the noise pulse on ALE line may exceed 0.8V . In such cases it may be desirable to qualify ALE with a schmitt-trigger, or use an address latch with a schmitt-trigger strobe input.
- 2) Capacitive loading on ports 0 and 2 may cause the V_{OH} on ALE and $\overline{\text{PSEN}}$ to momentarily fall below the $0.9V_{CC}$ specification when the address lines are stabilizing.
- 3) I_{CC} Max. at other frequencies is given by:
 active mode: $I_{CC} = 1.27 \times f_{OSC} + 5.73$
 idle mode: $I_{CC} = 0.28 \times f_{OSC} + 1.45$ (except OTP devices)
 where f_{OSC} is the oscillator frequency in MHz. I_{CC} values are given in mA and measured at $V_{CC} = 5\text{V}$.
- 4) I_{CC} (active mode) is measured with:
 XTAL1 driven with t_{CLCH} , $t_{CHCL} = 5\text{ns}$, $V_{IL} = V_{SS} + 0.5\text{V}$, $V_{IH} = V_{CC} - 0.5\text{V}$; XTAL2 = N.C.;
 $\overline{\text{EA}} = \text{Port0} = \text{RESET} = V_{CC}$; all other pins are disconnected. I_{CC} would be slightly higher if a crystal oscillator is used (appr. 1mA).
- 5) I_{CC} (Idle mode) is measured with all output pins disconnected and with all peripherals disabled;
 XTAL1 driven with t_{CLCH} , $t_{CHCL} = 5\text{ns}$, $V_{IL} = V_{SS} + 0.5\text{V}$, $V_{IH} = V_{CC} - 0.5\text{V}$; XTAL2 = N.C.;
 $\text{RESET} = \overline{\text{EA}} = V_{SS}$; Port0 = V_{CC} ; all other pins are disconnected;
- 6) I_{PD} (Power Down Mode) is measured under following conditions:
 $\overline{\text{EA}} = \text{Port0} = V_{CC}$; $\text{RESET} = V_{SS}$; XTAL2 = N.C.; XTAL1 = V_{SS} ; all other pins are disconnected.

AC Characteristics

Explanation of the AC Symbols

Each timing symbol has 5 characters. The first character is always a 't' (stand for time). The other characters, depending on their positions, stand for the name of a signal or the logical status of that signal. The following is a list of all the characters and what they stand for.

A: Address

C: Clock

D: Input Data

H: Logic level HIGH

I: Instruction (program memory contents)

L: Logic level LOW, or ALE

P: PSEN

Q: Output Data

R: RD signal

T: Time

V: Valid

W: WR signal

X: No longer a valid logic level

Z: Float

For example,

t_{AVLL} = Time from Address Valid to ALE Low

t_{LLPL} = Time from ALE Low to PSEN Low

AC Characteristics for HMS99C51S/52S/54S/56S/58S (12MHz version)

V_{CC} = 5V : $V_{CC} = 5V + 10\%, -15\%$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $85^{\circ}C$
(C_L for port 0, ALE and PSEN outputs = 100pF, C_L for all other outputs = 80pF)

Variable clock : $V_{CC} = 5V$: $1/t_{CLCL} = 3.5$ MHz to 12 MHz

External Program Memory Characteristics

Parameter	Symbol	12 MHz Oscillator		Variable Oscillator $1/t_{CLCL} = 3.5$ to 12MHz		Unit
		Min.	Max.	Min.	Max.

Parameter	Symbol	Variable Oscillator (Freq. = 3.5 to 40MHz)		Unit
		Min.	Max.	
Oscillator period	t _{CLCL}	30.3	285.7	ns
High time	t _{CHCX}	11.5	t _{CLCL} - t _{CLCX}	ns
Low time	t _{CLCX}	11.5	t _{CLCL} - t _{CHCX}	ns
Rise time	t _{CLCH}	-	5	ns
Fall time	t _{CHCL}	-	5	ns

**Figure 6. External Program Memory Read Cycle**

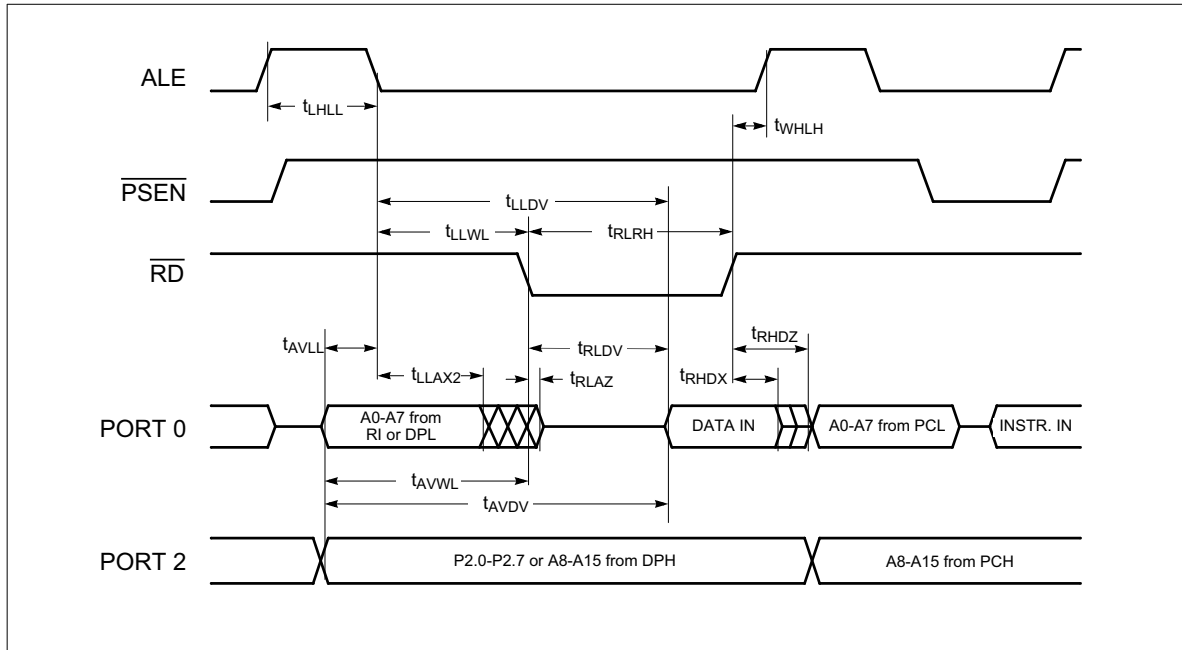

Figure 7. External Data Memory Read Cycle

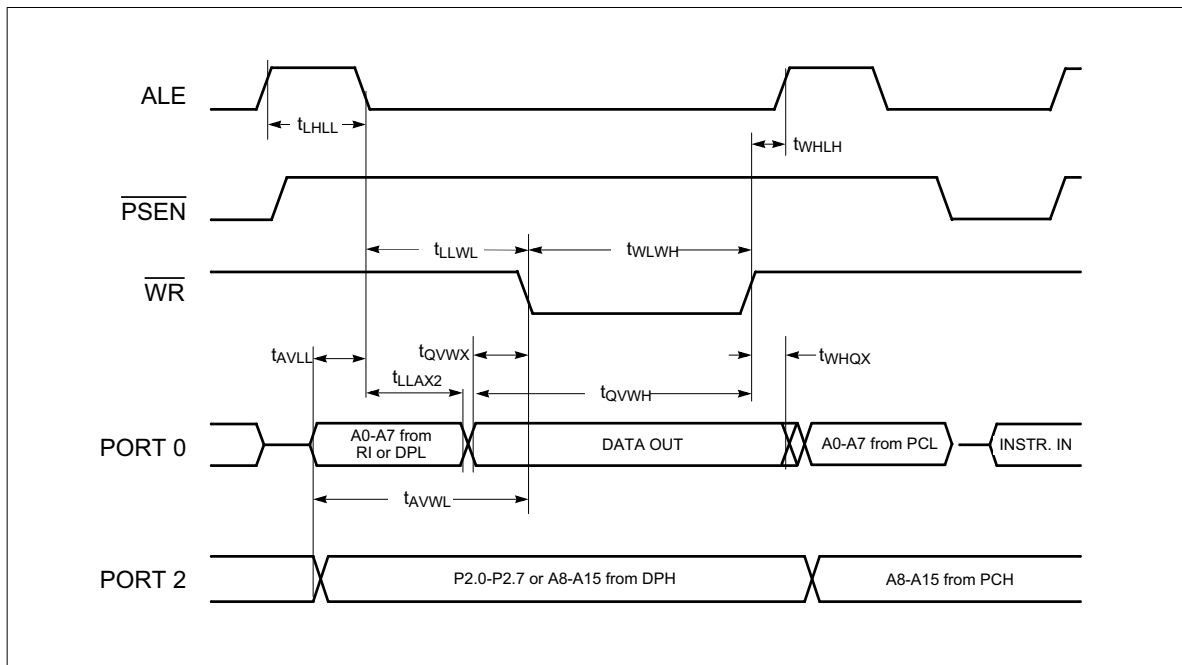

Figure 8. External Data Memory Write Cycle

AC Inputs during testing are driven at $V_{CC}-0.5V$ for a logic '1' and $0.45V$ for a logic '0'. Timing measurements are made at V_{IHmin} for a logic '1' and V_{ILmax} for a logic '0'.

Figure 9. AC Testing: Input, Output Waveforms

For timing purposes a port pin is no longer floating when a 100mV change from load voltage occurs and begins to float when a 100mV change from the loaded V_{OH} / V_{OL} level occurs.
 $I_{OL} / I_{OH} \geq 20mA$.

Figure 10. Float Waveforms

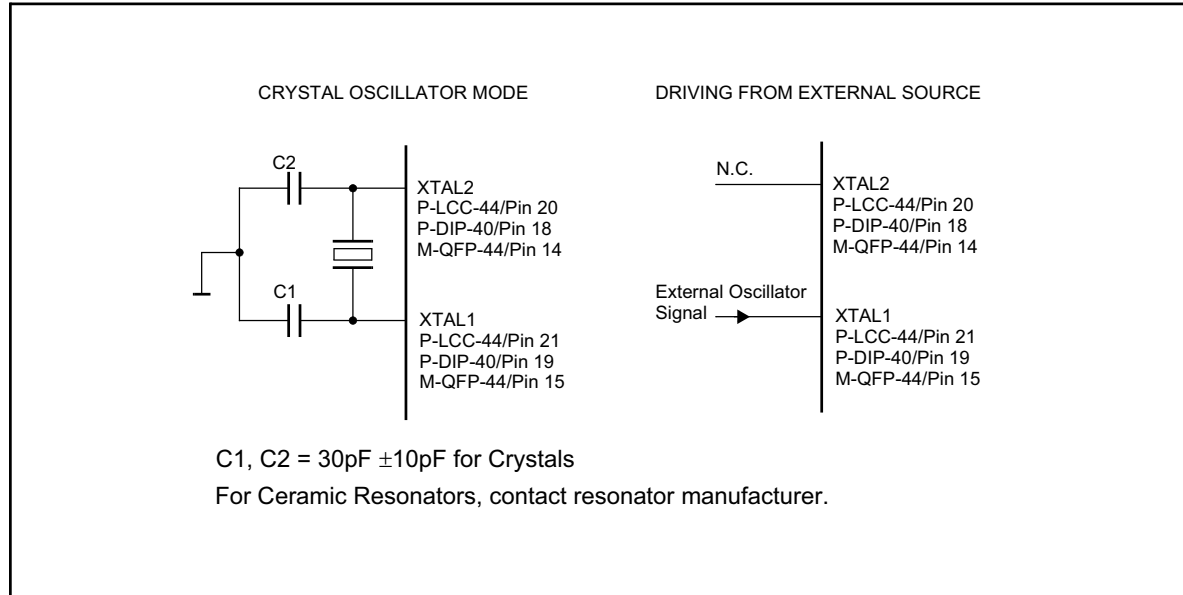

Figure 11. External Clock Cycle

OSCILLATOR CIRCUIT**Figure 12. Recommended Oscillator Circuits**

Oscillation circuit is designed to be used either with a ceramic resonator or crystal oscillator. Since each crystal and ceramic resonator have their own characteristics, the user should consult the crystal manufacturer for appropriate values of external components.

FLASH MEMORY

Overview

The Flash memory increases EPROM and ROM functionality with in-circuit electrical erasure and programming. It contains 4K, 8K, 16K, 24K or 32K bytes of program memory. This memory is both parallel and serial In-System Programmable (ISP). ISP allows devices to alter their own program memory in the actual end product under software control. A default serial loader (bootloader) program allows ISP of the Flash. The programming does not require 12V external programming voltage. The necessary high programming voltage is generated on-chip using the standard V_{CC} pins of the microcontroller.

Features

- Flash memory internal program memory.
- Default loader in Boot ROM allows programming via the serial port without the need of a user provided loader.
- Up to 64K byte external program memory if the internal program memory is disabled (EA = 0).
- Programming and erase voltage with standard 5V V_{CC} supply.
- Read/Programming/Erase:
 - Programming time per byte : 20us (TBD)
 - Block erase/Total Erase time : 200ms (TBD)
 - Typical programming time (32K bytes) is 10s at ISP mode (TBD)
- Parallel programming with Atmel/Philips chip compatible hardware interface to programmer
- Programmable security for the code in the Flash
- Endurance : 10,000 cycles (TBD)
- Data retention : 10 years (TBD)

Flash Programming and Erasure

There are three methods of programming the Flash memory:

- First, the on-chip ISP bootloader may be invoked which will use low level routines to program. The interface used for serial downloading of Flash memory is the UART.
- Second, the Flash may be programmed or erased in the end-user application by calling low level routines through a common entry point in the Boot ROM.
- Third, the Flash may be programmed using the parallel method by using conventional EPROM programmer. The commercially available programmers need to have support for the HMS99C51S/52S/54S/56S/58S. The bootloader routines are located in the Boot ROM.

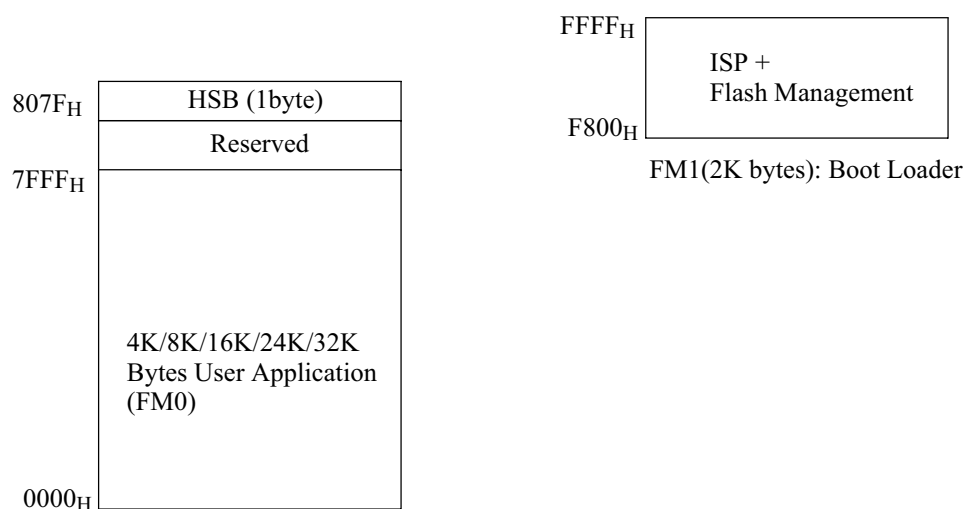

Flash Memory Architecture

HMS99C51S/52S/54S/56S/58S feature two on-chip Flash memories:

- Flash memory FM0:
4K/8K/16K/24K/32K bytes user program memory
- Flash memory FM1:
2K bytes for bootloader.

The FM0 and FM1 can be programmed by both parallel programming and Serial In-System Programming.

The ISP mode is detailed in the "In-System Programming" section.

FM0 Memory Architecture

- 4K/8K/16K/24K/32K bytes User Program Memory
- Hardware Security Bits (HSB)

User Space

This space is composed of a 4K/8K/16K/24K/32K bytes Flash memory. HMS99C51S/52S has only sectors of 2K byte unit block, and HMS99C54S/56S/58S has 4 sectors of 2K byte unit block and other sectors of 8K byte unit block. It contains the user's application code.

Hardware Security Byte

The Hardware Security Byte space is a part of HSB and has a size of 1 byte.

Cross Flash Memory Access Description

The FM0 and FM1 memory can be programmed by parallel programming.

The FM0 memory can be programmed from FM1. But, programming FM1 from FM0 or from external memory is impossible.

FM1 memory can be programmed only by parallel programming.

Code Executing from	Action		FM0 (User Flash)	FM1 (Boot Flash)
	FM0	Read	OK	-
		Write/Erase	-	-
	FM1	Read	OK	OK
		Write/Erase	OK	-

Table 11. Cross Flash Memory Access

Overview of FM0 Operations

The CPU interfaces to the Flash memory through the FCON register of SFR FCON register is used to:

- Select Register for operation of Flash Access (FRSEL[2:0])
- Erase Mode Select (ERASESEL)
- Enable Boot Flash (ENBOOT)
- 64K Bytes Internal Rom Access (INTROM_EN)
- Program Mode Select (PGMSEL)

Mapping of the Memory Space

By default, the user space is accessed by MOVC instruction for read only.

The other memory spaces (user, BOOT, HSB) are made accessible in the code segment by programming bits INTROM_EN, ENBOOT in FCON register in advance. A MOVC instruction is then used for reading these spaces in accordance with address of Table 12.

Region	Addr. 15	Addr. 14~11	Addr. 10~7	Addr. 6~0
HSB(1 Bytes)	1	0000	0111	1111
Boot(2K Bytes)		1111	Variable	Variable
User(32K Bytes)	0	Variable	Variable	Variable

Table 12. FM0 Blocks Select Bits

Flash Registers and Memory Map

The HMS99C51S/52S/54S/56S/58S Flash memory uses several registers for its management:

- Hardware registers can only be accessed through the parallel programming modes which are handled by the parallel programmer.

Hardware Register

The only hardware register of the HMS99C51S/52S/54S/56S/58S is called Hardware Security Byte(HSB).

-	-	-	BLJB_EN	BLJB	LB2	LB1	LB0
---	---	---	---------	------	-----	-----	-----

Table 13. Hardware Security Byte(HSB)

Bit No	Bit Mnemonic	Description
7~5	-	Reserved
4	BLJN_EN	Enable BLJB Bit 1 : BLJB is enabled for ISP Mode 0 : BLJB is disabled. (After finishing of download, must be programmed.)
3	BLJB	Boot Loader Jump Bit 1 : Start the user's application on next reset at address 0000 _H 0 : Start the boot loader at address F800 _H (Default).
2~0	LB2~0	User Memory Lock Bits See Table 14

1 : Unprogrammed

0 : Programmed

Note: HSB can be read but can not be programmed in ISP Mode and only programmable by specific tools.

Flash Memory Lock Bits

The three lock bits provide different levels of protection for the on-chip code and data, when programmed as shown in Table 14.

Program Lock Bit				Protection Description
Security Level	LB0	LB1	LB2	
1	U	U	U	No program lock features enabled.
2	P	U	U	MOVC instruction executed from external program memory is disabled from fetching code bytes from internal memory, EA is sampled and latched on reset, and further parallel programming of the Flash is disabled. ISP and software programming with ISP are still allowed.
3	X	P	U	Same as 2, also verify through parallel programming interface is disabled.
4	X	X	P	Same as 3, also external execution is disable.

Table 14. Program Lock Bits

Note: U : unprogrammed or "1", P : programmed or "0", X: don't care

Note: Security level 2 and 3 should only be programmed after Flash and code verification.

These security bits protect the code access through the parallel programming interface. They are set by default to level 1. Though at level 2, 3 and 4, the code access through the ISP is still possible.

Default Values

The default value of the HSB provides parts ready to be programmed with ISP

- BLJB_EN: BLJB bit is enabled or disabled.(default : disabled)
- BLJB: Programmed force ISP operation(Default : ISP inactivated)).
- LB2-0: Security level four to protect the code from a parallel access with maximum security.(Default : Level 1)

Software Security

The software security provide two different levels of protection for the on-chip code and data,

- Level 1 : No program lock features enabled.
- Level 2 : ISP programming and verify of the Flash is disabled.

Flash Memory Status

HMS99C51S/52S/54S/56S/58S themselves are delivered in standard with the ISP boot code in the Flash memory. After ISP or parallel programming, the possible contents of the Flash memory are summarized on Figure 13.

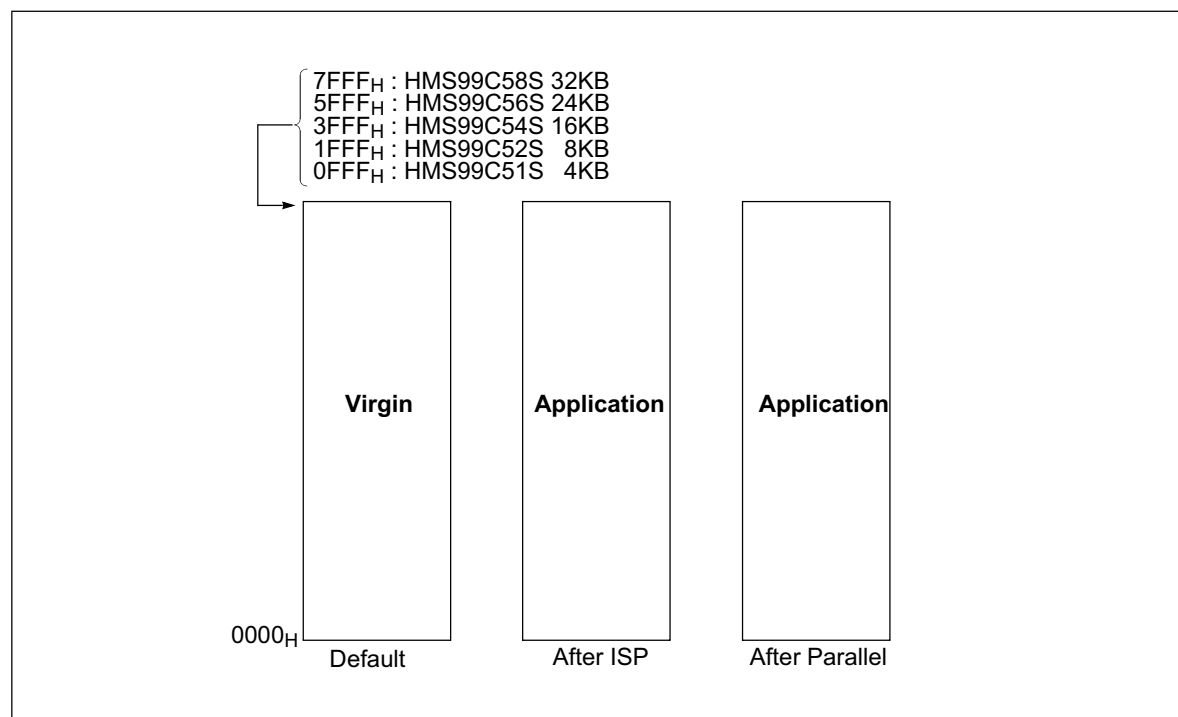

Figure 13. Flash Memory Possible Contents

Memory Organization

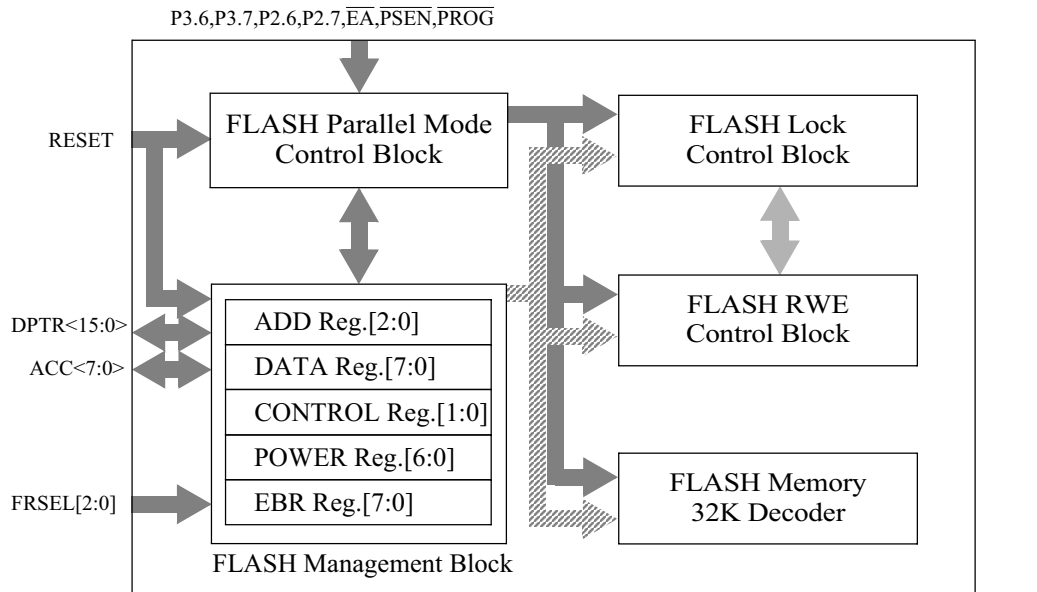

In the HMS99C51S/52S/54S/56S/58S, the lowest 4K, 8K, 16K, 24K or 32K of the 64 KB program memory address space is filled by internal Flash cells. When the \overline{EA} pin is high, the processor fetches instructions from internal program Flash memory. Bus expansion for accessing program memory from 4K, 8K, 16K, 24K or 32K is upward since external instruction fetches occur automatically when the program counter exceeds 0FFFh(4K), 1FFFh(8K), 3FFFh(16K), 5FFFh(24K) or 7FFFh (32K).

If the \overline{EA} pin is tied low, all program memory fetches are from external memory.

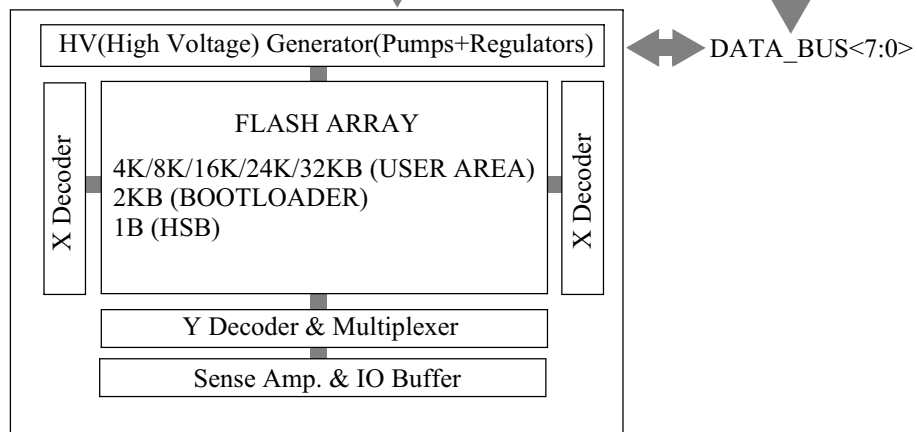

Flash Management Block

- Flash Management Block is controlled by ISP Command
-

FLASH DIGITAL BLOCK

FLASH ANALOG BLOCK

SFR Register for a ISP Mode

FCON register exists in D1_H in SFR region and defines selection of Flash register operation, R/W for a Flash Registers, BOOT Flash usage, selection of Flash Memory Space and selection of Program location.

D0 _H	PCON 00000000 _B	FCON 00000000 _B	-	-	-	-	D7 _H

Table 19. Erase Block Register(EBR)

Bootloader Architecture

Introduction

The bootloader manages a communication according to a specific defined protocol to provide the whole access and service on Flash memory. Furthermore, all accesses and routines can be called from the user application

The Flash bootloader includes:

- The serial communication protocol
- The ISP command decoder

In order to access User FLASH area at a custom bootloader, User must modify the related FLASH registers directly.

This may be necessary in case of :

- Another communication interface
- Different protocol (other data format, encrypted data, etc.)
- Flash areas protection
- Flash areas checks (CRC, etc.)

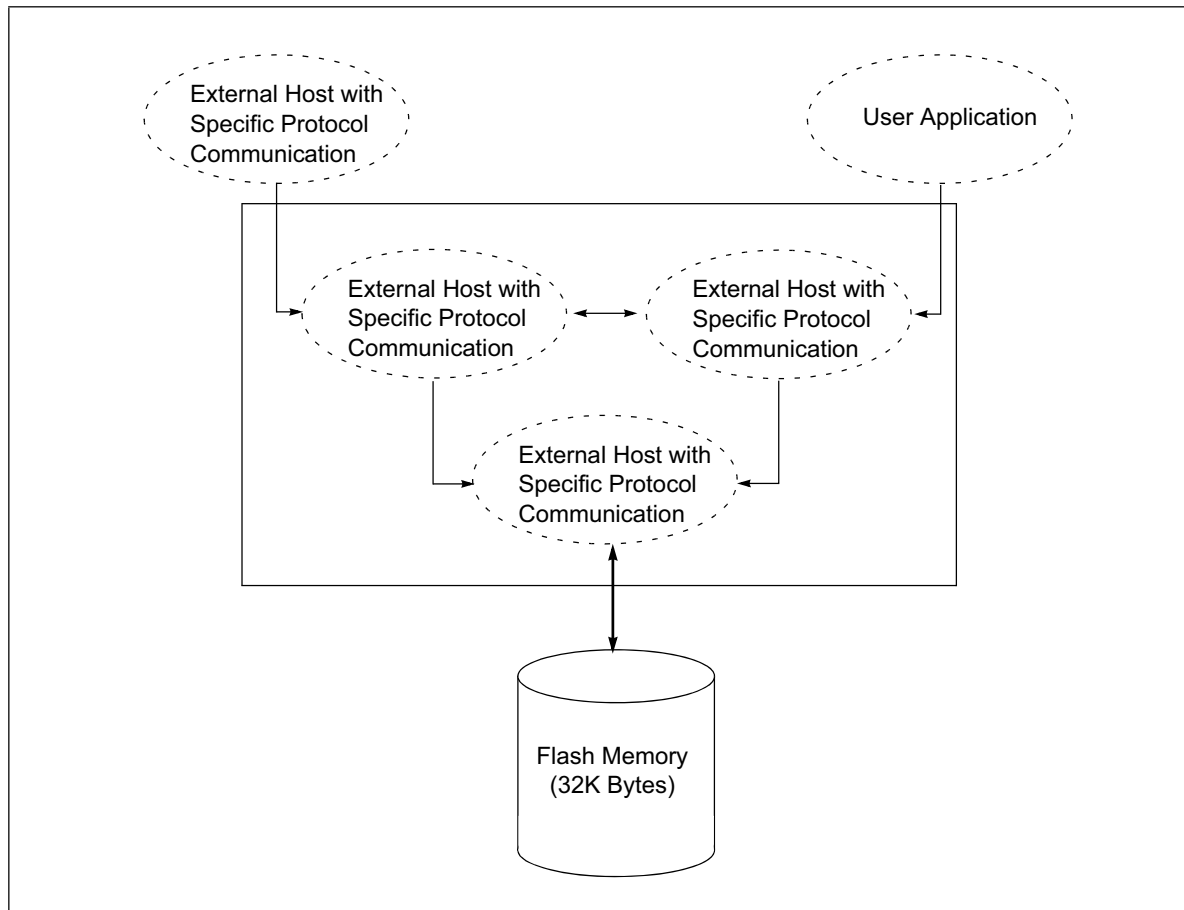

Figure 14. Diagram Context Description

Bootloader Functional Description**Figure 15. Bootloader Functional Description**

On the above diagram, the on-chip bootloader processes are:

- **ISP Communication Management**

The purpose of this process is to manage the communication and its protocol between the on-chip bootloader and an external device. The on-chip boot ROM implements a serial protocol. This process translates serial communication frame (UART) into Flash memory access (read, write, erase, ...)

- **Flash Memory Management**

This process manages low level access to Flash memory (performs read, write and erase access).

Bootloader Process

The bootloader can be activated by Hardware conditions. The Hardware conditions ($\overline{\text{PSEN}} = 0$, $\overline{\text{EA}} = 1$, $\text{ALE} = 1$) during the Reset falling edge force the on-chip bootloader execution. This allows an application to be built that will normally execute the end user's code but can be manually forced into default ISP operation. As $\overline{\text{PSEN}}$ is an output port in normal operating mode (running user application or bootloader code) after reset, it is recommended to release $\overline{\text{PSEN}}$ after falling edge of reset signal. The hardware conditions are sampled at reset signal falling edge, thus they can be released at any time when reset input is low. The on-chip bootloader boot process is shown in Figure 16.

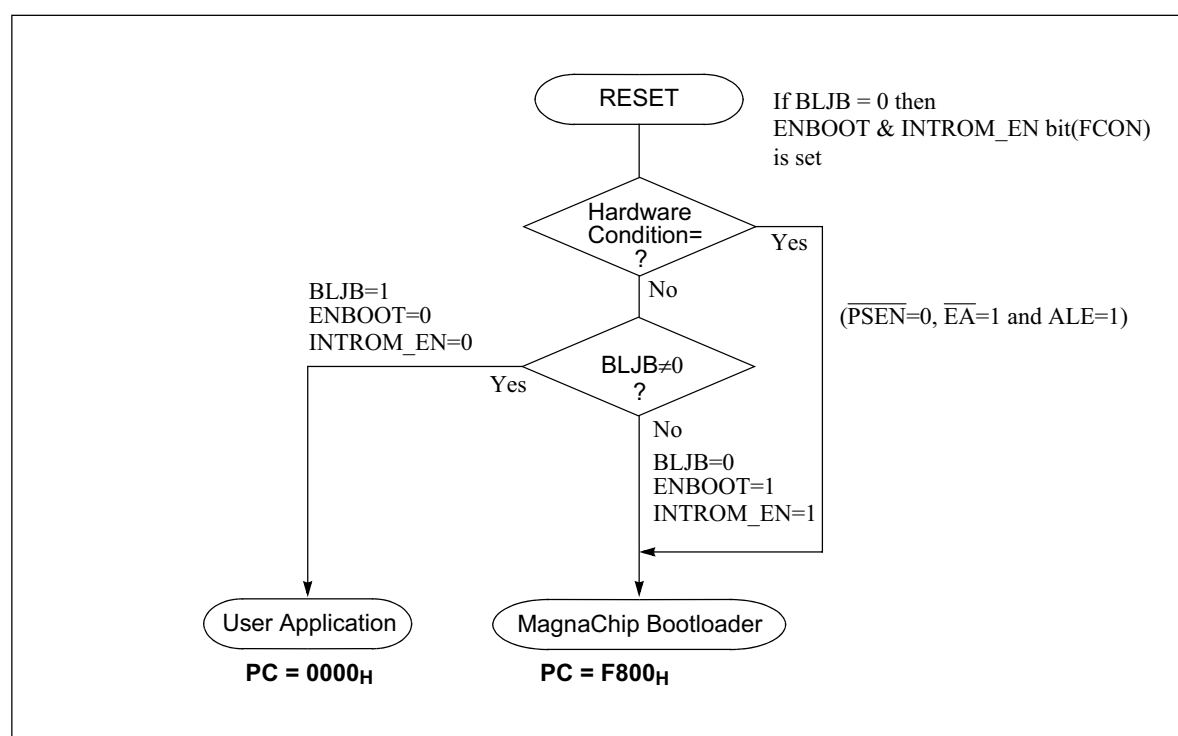

Figure 16. Bootloader Process by hardware

IN-SYSTEM PROGRAMMING (ISP)

The In-System Programming (ISP) is performed without removing the microcontroller from the system. The ISP facility consists of a series of internal hardware resources coupled with internal firmware to facilitate remote programming of the HMS99C51S/52S/54S/56S/58S through the serial port. The MagnaChip Microcontrollers ISP facility has made in-circuit programming in an embedded application possible with a minimum of additional expense in components and circuit board area. The ISP function through UART uses four pins: TxD, RxD, V_{SS}, and V_{CC}. Only a small connector needs to be available to interface the application to an external circuit in order to use this feature.

Using In-System Programming (ISP)

The ISP feature allows a wide range of baud rates in the user application. It is also adaptable to a wide range of oscillator frequencies. This is accomplished by measuring the bit-time of a single bit in a received character. This information is then used to program the baud rate in terms of timer counts based on the oscillator frequency.

The ISP feature requires that an initial character(an uppercase U) be sent to the HMS99C51S/52S/54S/56S/58S to establish the baud rate. The ISP firmware provides auto-echo of received characters. Once baud rate initialization has been performed, the ISP firmware will only accept Intel Hex-type records. Intel Hex records consist of ASCII characters used to represent hexadecimal values and are summarized below:

:NNAAAARRDD...DDCC

HMS99C51S/52S/54S/56S/58S will accept up to 16(10_H) data bytes. The “AAAA” string represents the address of the first byte in the record. If there are zero bytes in the record, this field is often set to “0000”. The “RR” string indicates the record type. A record type of “00” is a data record. A record type of “01” indicates the end-of-file mark. In this application, additional record types will be added to indicate either commands or data for the ISP facility. The “DD” string represents the data bytes. The maximum number of data bytes in a record is limited to 16(decimal). The “CC” string represents the checksum byte. ISP commands are summarized in Table 22. As a record is received by the HMS99C51S/52S/54S/56S/58S, the information in the record is stored internally and a checksum calculation is performed and compared to “CC”. The operation indicated by the record type is not performed until the entire record has been received. Should an error occur in the checksum, the HMS99C51S/52S/54S/56S/58S will send an “X” out the serial port indicating a checksum error. If the checksum calculation is found to match the checksum in the record, then the command will be executed. In most cases, successful reception of the record will be indicated by transmitting a “.” character out the serial port(displaying the contents of the internal program memory is an exception). In the case of a Data Record(record type “00”), an additional check is made. A “.” character will NOT be sent unless the record checksum matched the calculated checksum and all of the bytes in the record were successfully programmed.

For a data record, an “X” indicates that the checksum failed to match, and an “R” character indicates that one of the bytes did not properly program.

MagnaChip ISP, a software utility to implement ISP programming with a PC, is available from the MagnaChip web site. The users of this ISP function should use this MagnaChip ISP software for proper flash ROM control and operation.

RECORD TYPE	COMMAND/DATA FUNCTION
00	Program Data Record :nnaaaa00dd. . . ddcc Where: nn = number of bytes(hex) in record aaaa = memory address of first byte in record dd....dd=databytes cc = checksum Example: :05008000AF5F67F060B6
01	End of File (EOF), no operation :xxxxxx01cc Where: xxxxxx = required field, but value is a "don't care" cc = checksum Example: :00000001FF
02	Specify Erase/Write Pulse :03xxxx02wweellcc Where: xxxx = required field, but value is a "don't care" ww = write pulse ee = erase pulse high byte ll = erase pulse low byte cc = checksum Example: :03000002789C40A7
03	Miscellaneous Write Functions :nnxxxx03ffssddcc Where: nn = number of bytes(hex) in record xxxx = required field, but value is a "don't care" 03 = Write Function ff = subfunction code ss = selection code dd = data input(as needed) cc = checksum Subfunction Code = 01(Erase Block) ff = 01 ss = block index in bits 6:0 (block number is designated by bit position) Example: :020000030122D8 erase block 1 and 5 (position of bit 1 and 5) Subfunction Code = 05 (Program Software Security Bits) ff = 05 program software security bit (Level 2 inhibit reading/writing to Flash) Example: :0100000305F7 (program security bit)

		07 _H	00 _H	Read Security Information
			03 _H	Read Oscillator Information

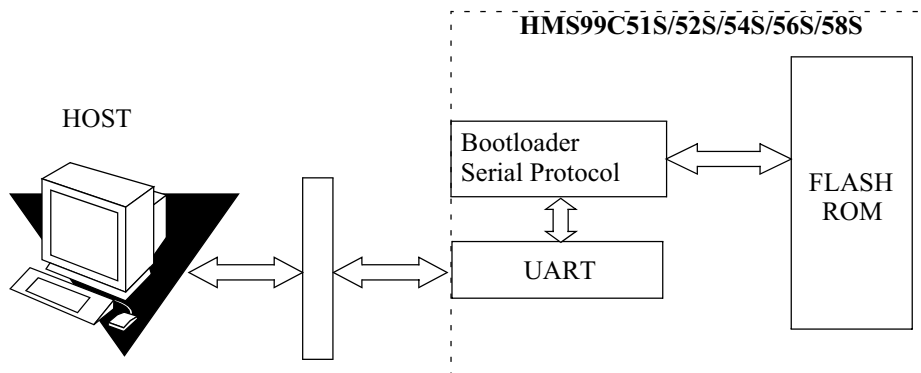

Table 21. ISP Commands Summary

Serial Protocol

This application note describes the Serial Protocol used to program the Flash code memory from MagnaChip microcontrollers. Commands sent over the serial line are interpreted by the on-chip bootloader program.

This applied for HMS99C51S/52S/54S/56S/58S.

This protocol is a serial UART protocol.

Protocol Configuration

1. Physical Layer

The UART used to transmit information has the following configuration:

- Character: 8-bit data
- Parity: none
- Stop: 1 bit
- Flow control: none
- Baudrate: autobaud is performed by the bootloader to compute the baudrate chosen by the host.

2. Frame Description

The Serial Protocol is based on the Intel Hex-type records.

Intel Hex records consist of ASCII characters used to represent hexadecimal values and are summarized below:

Record Mark '.'	Reclen	Load Offset	Record Type	Data or Info	Checksum
1 Byte	1 Byte	2 Byte	1 Byte	n Byte	1 Byte

- Record Mark:

Record Mark is the start of frame. This field must contain ‘:’.

- Reclen:

Reclen specifies the number of bytes of information or data which follows the Record Type field of the record.

- Load Offset:

Load Offset specifies the 16-bit starting load offset of the data bytes, therefore this field is used only for Data Program Record(see Table 20).

- Record Type:

Record Type specifies the command type. This field is used to interpret the remaining information within the frame. The encoding for all the current record types is described in Table 20.

- Data/Info:

Data/Info is a variable length field. It consists of zero or more bytes encoded as pairs of hexadecimal digits. The meaning of data depends on the Record Type.

- Checksum:

The two's complement of bytes that result from converting each pair of ASCII hexadecimal digits to one byte of binary, and including the Reclen field to and including the last byte of the Data/Info field. Therefore, the sum of all the ASCII pairs in a record after converting to binary, from the Reclen field to and including the Checksum field, is zero.

Note: 1. A data byte is represented by two ASCII characters

2. When the field Load Offset is not used, it should be coded as four ASCII zero characters ('0').

Protocol Description

1. Overview

An initialization step must be performed after each Reset. After microcontroller reset, the bootloader waits for an autobaud sequence. When the communication is initialized, the protocol depends on the record type requested by the host.

2. Communication Initialization

The host initializes the communication by sending a “U” character to help the bootloader to compute the baudrate (autobaud).

3. Command Data Stream Protocol

All commands are sent using the same flow.

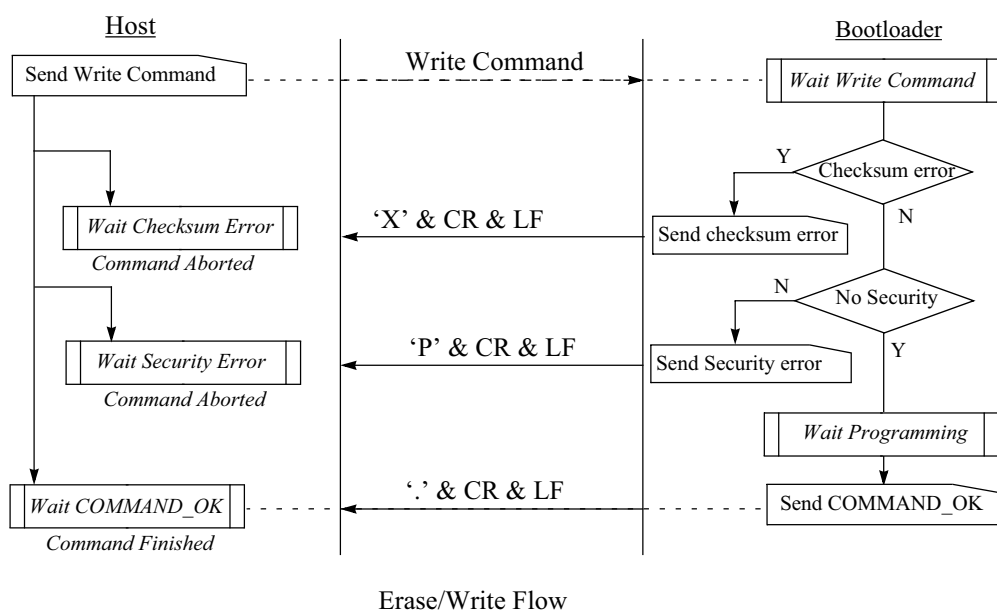

Note: All commands sent with the echo mechanism will be represented by:

3.1 Write / Program Commands

This flow is common to the following frames:

- Flash Programming Data Frame
- EOF or MagnaChip Frame (only Programming MagnaChip Frame)
- Erase/Write Timing Frame
- Lockbit Programming Data Frame

a. Description

b. Example

HOST : 01 0010 00 55 9A

BOOTLOADER : 01 0010 00 55 9A . CR LF

Programming Data (write 55_H at address 0010_H in the Flash)

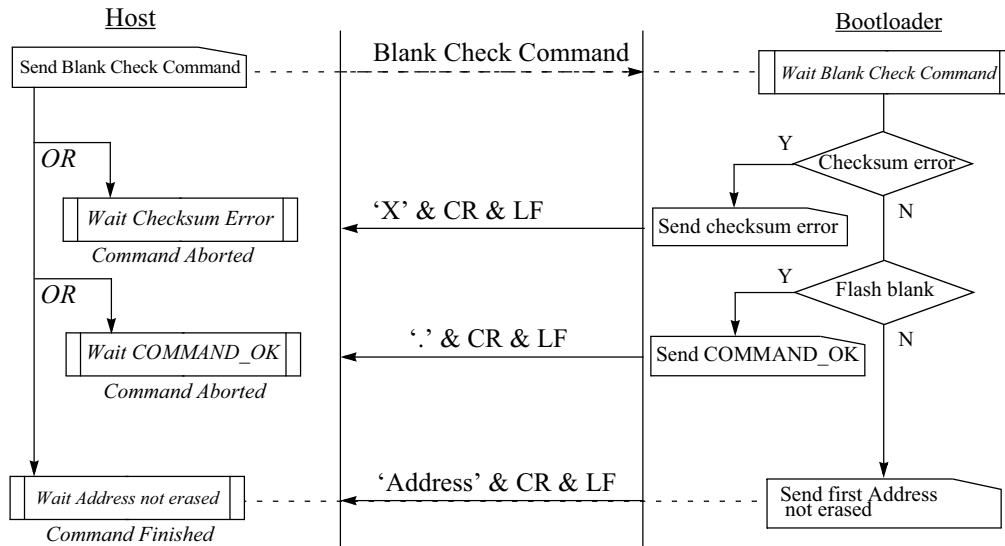

HOST : 02 0000 03 05 01 F5

BOOTLOADER : 02 0000 03 05 01 F5. CR LF

Programming Lockbit function (write Software Security to level 2)

3.2 Blank Check Command

a. Description

Blank Check Flow

b. Example

HOST : 05 0000 04 0000 7FFF 01 78

BOOTLOADER : 05 0000 04 0000 7FFF 01 78 . CR LF

Blank Check ok

BOOTLOADER : 05 0000 04 0000 7FFF 01 70 X CR LF CR LF

Blank Check with checksum error

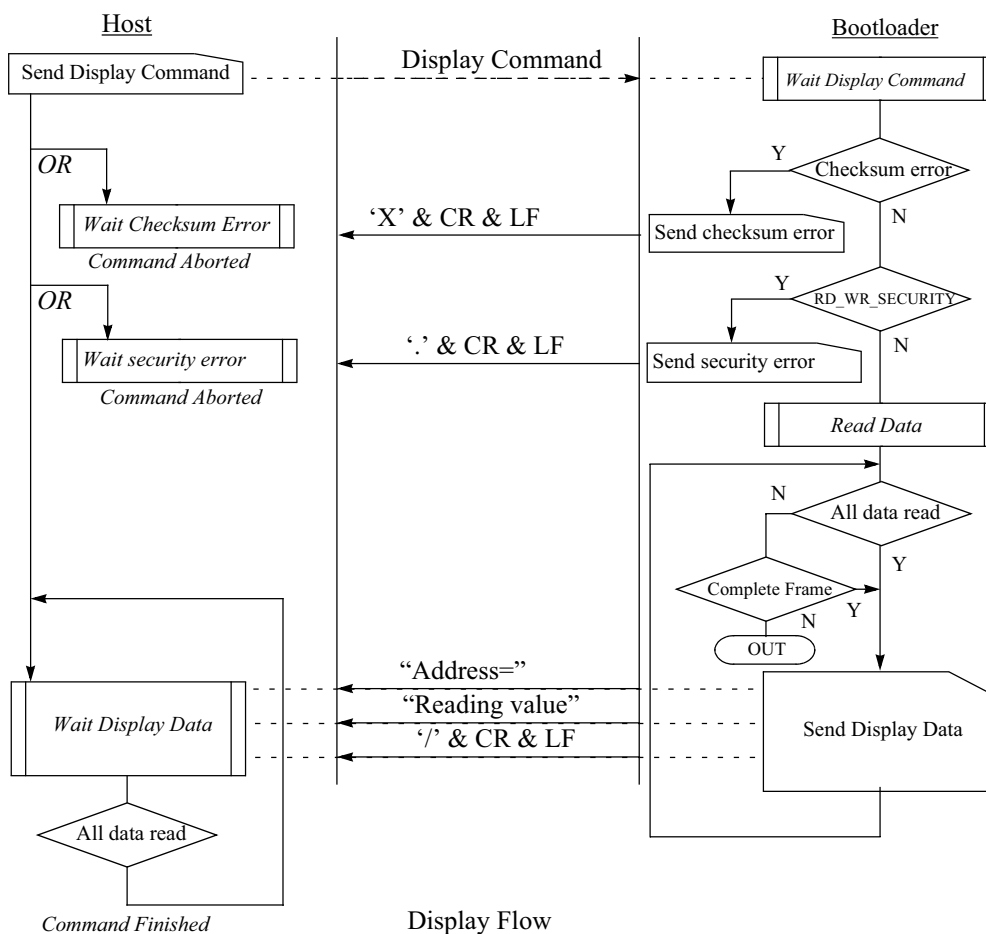

HOST : 05 0000 04 0000 7FFF 01 70

BOOTLOADER : 05 0000 04 0000 7FFF 01 78 xxxx CR LF

Blank Check failure at address xxxx

3.3 Display Data

a. Description

Note: The maximum size of display block is equal to the Flash ROM size.

b. Example

HOST : 05 0000 04 0000 0020 00 D7

BOOTLOADER : 05 0000 04 0000 0020 00 D7

BOOTLOADER 0000=-----data----- / CR LF (16 data)

BOOTLOADER 0010=-----data----- / CR LF (16 data)

BOOTLOADER 0020=data CR LF (1 data)

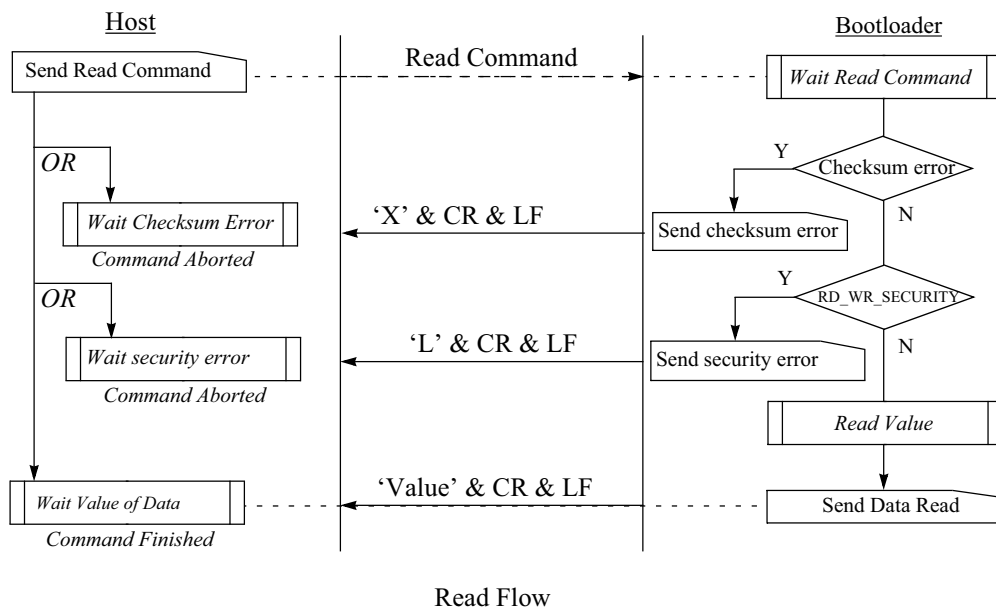

Display data from address 0000_H to 0020_H

3.4. Read Function

This flow is similar for the following frames:

- Reading Frame
- EOF Frame/ MagnaChip Frame (only reading MagnaChip Frame)

a. Description

b. Example

HOST : 02 0000 05 00 01 F8

BOOTLOADER : 02 0000 05 00 01 F8 Value . CR LF

Read function (read device ID)

ISP METHOD FOR PC(MAGNACHIP WINISP)

Getting Started / Installation

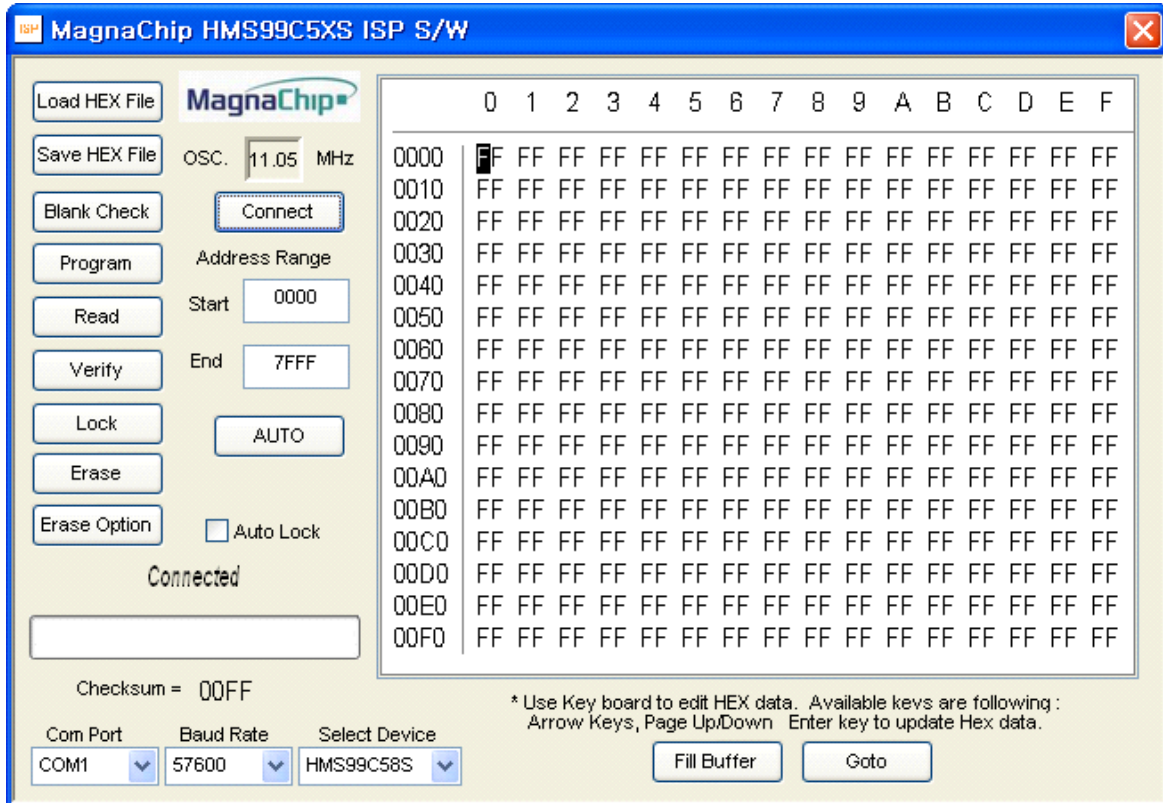

The following section details the procedure for accomplishing the installation procedure.

- 1. Connect the serial(RS-232C) cable between a target board and the COM1 serial port of your PC.**
- 2. Configure the COM1 serial port of your PC as following.**
 - Baudrate : 115,200
 - Data bit : 8
 - Parity : No
 - Stop bit : 1
 - Flow control : No
- 3. Turn your target B/D power switch ON.**
Your target B/D must be configured to enter the ISP mode.
- 4. Run the MagnaChip ISP software.**
- 5. Press the Reset Button in the ISP S/W.**

If the status windows shows a message as "Connected", all the conditions for ISP are provided.

If you press the Reset button again after connected, the status windows will show the message as "Disconnected". Please discard it because the HMS99C51S/52S/54S/56S/58S can not check the reset button after connected successfully.

Basic Information

MagnaChip HMS99C5XS ISP S/W

Load HEX File Save HEX File Blank Check Program Read Verify Lock Erase Erase Option ☐ Auto Lock

OSC. 11.05 MHz Connect

Address Range Start 0000 End 7FFF AUTO

Connected

Checksum = 00FF

Com Port Baud Rate Select Device

COM1 57600 HMS99C58S

Fill Buffer Goto

* Use Key board to edit HEX data. Available keys are following :
Arrow Keys, Page Up/Down Enter key to update Hex data.

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

Function	Description
Load HEX File	Load the data from the selected file storage into the memory buffer.
Save HEX File	Save the current data in your memory buffer to a disk storage by using the Intel HEX format.
Erase	Erase the data in your target MCU before programming it.
Blank Check	Verify whether or not a device is in an erased or unprogrammed state.
Program	This button enables you to place new data from the memory buffer into the target device.
Read	Read the data in the target MCU into the buffer for examination. The checksum will be displayed on the checksum box.
Verify	Assures that data in the device matches data in the memory buffer. If your device is secured, a verification error is detected.
Lock	Secures devices so that their content can no longer be examined or modified.

Table 22. ISP Function Description

Function	Description
Erase Option	Select blocks for Erasure.
AUTO	Blank Check & Program & Verify
Auto Lock	If selected with check mark, the security locking is performed after erasure.
Connect	Connect a MCU in your target Board with displaying as "Connected" in the status box. Users have to press this button at least one time to initialize a target MCU for entering the ISP mode. If failed to enter the ISP mode, all the buttons are unavailable. And, after entering successfully, the Connect button will be unavailable.
Edit Buffer	Modify the data in the selected address in your buffer memory
Fill Buffer	Fill the selected area with a data.
Goto	Display the selected page.
OSC. _____ MHz	Display your target system's oscillator value with discarding below point.
Start _____	Starting address
End _____	End address
Checksum=8000	Display the checksum(Hexdecimal) after reading the target device.
Com Port	Select serial port.
Baud Rate	Select UART baud rate.
Select Device	Select target device.
Page Up Key	Display the previous page of your memory buffer.
Page Down Key	Display the higher page than the current location.

Table 22. ISP Function Description

Hardware Conditions to Enter the ISP Mode

The In-System Programming (ISP) is performed without removing the microcontroller from the system. The In-System Programming (ISP) facility consists of a series of internal hardware resources coupled with internal firmware through the serial port. The In-System Programming (ISP) facility make in-circuit programming in an embedded application possible with a minimum of additional expense in components and circuit board area.

The bootloader can be executed by holding $\overline{\text{PSEN}}$ LOW, $\overline{\text{EA}}/\text{V}_{\text{PP}}$ greater than V_{IH} (such as +5V), and $\text{ALE}/\overline{\text{PROG}}$ HIGH at the falling edge of RESET. The ISP function block uses four pins: TxD, RxD, V_{SS} , and V_{CC} . Only a small connector needs to be available to interface your application to an external circuit in order to use this feature.
